Strategic technology partnership combines simulation delivery and operations to elevate program efficiency and standardize healthcare training

DALLAS, Texas, October 28th, 2026 – SIMStation, a global provider of healthcare simulation technology, and Simuhealth, a leading healthcare simulation operations platform, today announced a strategic technology partnership. The collaboration brings together two complementary areas of expertise with the shared goal of reducing disconnected processes and supporting a more seamless approach to managing and delivering healthcare simulation.

Simulation centers often depend on multiple systems to plan programs, coordinate participants and resources, conduct simulation sessions, assess performance, and report results. The partnership between SIMStation and Simuhealth responds to growing market demand for greater connectivity across these workflows.

Simuhealth provides the operational infrastructure used to plan and run simulation programs, including scheduling, participant and faculty coordination, staff and equipment management, attendance tracking, and operational reporting. As a comprehensive system of record, Simuhealth can be deployed across multi-site programs and regional networks, providing system-wide visibility and the analytics needed to demonstrate ROI and support accreditation.

SIMStation provides the technology ecosystem through which simulations and structured assessments are prepared, delivered, observed, recorded, assessed, and debriefed. Building on more than 13 years of experience in audiovisual recording and debriefing, SIMStation has developed into a comprehensive ecosystem encompassing simulation center workflows, OSCEs and other structured assessments, event planning, checklists, reporting, and continuously expanding AI-supported capabilities.

"SIMStation has evolved from an audiovisual recording and debriefing specialist into a comprehensive ecosystem for simulation, assessment, and intelligent workflows," said Steven Matthews, CEO of SIMStation. "Partnering with Simuhealth allows us to connect that ecosystem with the wider operational environment of a simulation program and build toward a more seamless future for healthcare simulation."

"Simulation is the future of training for the world's most important workforce, yet it is being held back by disconnected systems and manual coordination," said Matthew Housser, CEO and co-founder of Simuhealth. "By joining forces with SIMStation, we are connecting program operations with the technology used to run, assess, and continuously improve simulation training. This partnership creates a strong foundation for more connected workflows, better data sharing, and a more seamless experience for educators and operators."

The partnership is aimed at simulation program leaders, educators, operations specialists, and technical teams across hospitals, universities, nursing schools, academic simulation centers, and multi-site healthcare systems.

By combining SIMStation's expertise in running simulation and assessment workflows with Simuhealth's focus on program and center operations, the companies aim to help simulation professionals spend less time coordinating disconnected systems and more time delivering high-quality education and training.

Further information about both companies and the future development of the partnership is available at www.simstation.com and www.simu.health.

About SIMStation

SIMStation provides a comprehensive technology ecosystem for healthcare simulation and structured medical assessment. Its solutions combine intuitive software, professional audiovisual infrastructure, simulation management, recording and debriefing, OSCE workflows, assessments and reporting. For more than 13 years, SIMStation has helped educators and simulation operators deliver reliable, efficient, and high-quality training experiences. With headquarters in Dallas, Texas, and Vienna, Austria, SIMStation supports more than 700 customers worldwide.

About Simuhealth

Simuhealth is a healthcare simulation operations platform designed to help organizations coordinate and manage scenarios, learners, staff, rooms, and equipment in one system. The platform supports scheduling, resource management, program administration, compliance tracking, and operational reporting, helping simulation teams reduce administrative effort and gain greater visibility across their programs.
